ABOUT ME

Python backend developer focused on building production-grade systems with Django and FastAPI. Currently designing and developing **NIVI** — a multilingual marketplace platform for the Javakheti region of Georgia — as a solo founder, applying modular monolith architecture, layered service design, PostgreSQL, and Cloudflare R2 media pipelines. Previously completed a Python developer traineeship at Andersen, contributing to a microservices-based platform with FastAPI and SQLAlchemy. Strong focus on clean architecture, async Python, code quality (PyTest, Ruff, Mypy), and Agile collaboration.

EXPERIENCE

Founder & Backend Developer — [NIVI \(nivi.ge\)](https://nivi.ge)

Local multilingual marketplace for the Javakheti region of Georgia

2025 — Present

Designed and built NIVI end-to-end as solo founder and developer — a structured 4-language (hy/ka/ru/en) marketplace addressing chaotic Facebook-group commerce in Javakheti through SMS-verified accounts, granular geo filtering, and AI-driven translation. MVP launched May 2026.

- Architected a modular monolith on Django 5 with 8 strictly bounded apps (accounts, geo, categories, listings, moderation, interactions, notifications, core) and a layered HTTP → service → model design.
- Built SMS OTP authentication with rate-limiting and brute-force protection, hierarchical geography (Region → District → Village), MPTT-based categories, and a moderation pipeline with independent publication and report queues.
- Implemented multilingual content via static i18n (django-modeltranslation) and a dynamic ListingTranslation model preparing for an AI auto-translation pipeline.
- Integrated Cloudflare R2 media storage with Pillow-based image processing (WebP conversion, EXIF correction, resize) and automatic cleanup via django-cleanup signals.
- Set up background processing with Django-Q2 (PostgreSQL-backed broker), cron-style cleanup tasks via croniter, and full async-ready stack on uvicorn.
- Enforced engineering quality through pytest-django, Ruff, pre-commit hooks, transactional service operations, and full_clean()-based validation at the service layer.

Tech stack: Python 3.12, Django 5, PostgreSQL + psycopg3, uvicorn (ASGI), Django-Q2, Cloudflare R2, Pillow, django-mptt, django-modeltranslation, django-cleanup, pytest-django, Ruff, pre-commit, python-decouple, croniter.

Python Developer (Traineeship Program) — Andersen

Project: RMT Reborn — microservices platform (Technology)

01.2026 — 04.2026

Completed a structured Python developer traineeship at Andersen (240 academic hours, certified) and contributed to RMT Reborn — a modernized, microservices-based platform rebuilt for scalability, resilience, and maintainability, with services communicating via APIs.

- Acted as the first Python developer on the team — set up and configured the Python development environment and established workflows alongside an existing Java-based architecture.
- Developed new Python-based services within the existing microservices architecture, following Clean Architecture and DDD principles.
- Maintained code quality standards and technical documentation; supported and mentored new Python trainees joining the team.
- Collaborated with cross-functional teams to design and implement backend solutions, analyse requirements, and translate them into technical implementations.
- Worked in an Agile environment (Scrum / Kanban) with iterative development, task management in Jira, and code review processes.

Tech stack: Python, FastAPI, asyncio, SQLAlchemy, Alembic, PostgreSQL, Dishka, Ruff, Mypy, pre-commit, REST API, OpenAPI, Microservices, Docker, Docker Compose, PyTest, Clean Architecture, Jira, Agile (Scrum, Kanban).

OTHER PROJECTS

Telegram Analytics Bot — Python, aiogram, PostgreSQL

Built an asynchronous Telegram bot for Russian natural-language video analytics. Developed a deterministic NLP → QueryObject → SQL pipeline using LLM function calling, strict schema enforcement, and semantic validation. Implemented dynamic aggregate SQL queries over PostgreSQL with layered validation and error handling.

Django Piscine — Python, Django, PostgreSQL

A full-stack development program focused on building scalable Django applications. Implemented authentication, session management, ORM optimization, and RESTful API structure using PostgreSQL. Gained hands-on experience in performance tuning, internationalization (i18n), and real-world backend architecture.

Todo Server — Python, Django

Developed a task scheduler web application using Django 4.2, enabling users to organize notes and manage tasks. Consolidated knowledge of Python and web development frameworks.

EDUCATION

42 Yerevan 2024 — Present
Computer Science

Yerevan State College of Informatics 2019 — 2023
Software Engineer — Computer Facilities and Automated Systems Software

CERTIFICATIONS

- **Python (240 academic hours)** — Andersen, March 2026.
- **Antiphishing (4 hours)** — Andersen, February 2026.

TECHNICAL SKILLS

Languages	Python, SQL, C/C++
Frameworks	FastAPI, Django, aiogram, asyncio
Databases	PostgreSQL, MySQL, SQLAlchemy, Alembic
Architecture	Microservices, REST API, OpenAPI, Clean Architecture, DDD, OOP/OOD
DevOps & Tools	Docker, Docker Compose, Git, GitLab, GitHub Actions, Unix/Linux
Quality & Testing	PyTest, Ruff, Mypy, pre-commit
Dependency Injection	Dishka
Process	Agile (Scrum, Kanban), Jira

LANGUAGES

Armenian — Native Russian — Fluent English — B1+ (Intermediate)

SOFT SKILLS

Teamwork • Mentoring • Code Review • Critical Thinking • Time Management • Clear Communication
